## Hampton bay antigua ceiling fan parts

Hampton Bay Wireless Remote Control Unsupported Video Playback for ceiling fans can be used to control fans and lights on many different rowing fan brands. To install, turn off the power to the fan, plug the controller into the cable, and you're ready to go. The remote operates up to 30' away from the fan. These include three-speed fan control, and light control that can be used on dimmable incandescent bulbs or CFL and LED bulbs. Hampton Bay Wireless Remote Control is available at The Home Depot. Watch this video to find out more. VIDEO TRANSCRIPT Jodi Marks: Installing a ceiling fan with a lightweight kit is another great lighting option for your home. And if you're going to go to the time and cost of installing a ceiling fan, think about it. This is a neat little addition to it. This is a handheld wireless remote for your ceiling fan by Hampton Bay. Now, you don't need to have a Hampton Bay ceiling fan for this to operate, as it operates a variety of brands. The nice thing about this is that you can be 10 meters away from your ceiling fan and still operate it. Because, think about it, usually your electrician will wire fixtures over your head in your room to have two switches, one for the fan and one for light. Or if you're unlucky, you have an electrician who might only have one switch on the door, and it will control the light and fan at the same time. But with this remote control, it doesn't matter how it's wired on the wall. You can control it with just a click of a button. Now, you can dim the incandescent lamp, and there are settings for it. Or if you don't want to dim the lights, let's say you use LEDs or fluorescent, all you do is use other settings. And you can turn the lights on and off. Either way, you've got master control here. And who doesn't need another remote control there that they want! Audio Playback Is Not Supported When the ceiling fan operates in cooling mode, you should be able to stand underneath it and see the fan bar moving in the counterclockwise direction. This power airs to us, making the room feel cooler than the thermometer actually says it is, like the cold wind the weather guy talks about in winter. To get the maximum effect from the fan, it must hang as far as possible from the ceiling so that air flow is less restricted. Fans with longer blades tend to move more air. But the better philosophy does not last when it comes to the number of knives or their width. Six knife fans or those with large decorative blades actually move less air because there is less space between the blades to pull the air through. We independently research, test and recommend the best products; You can learn more about our review process here. We may receive commissions for purchases made from links of our choice. Final Verdict For an attractive ceiling fan that also offers two-light features, we recommend the 52-inch Transitional Hunter Fan (see on Amazon). It is very quiet and has a reversible motor that is useful in summer and winter. If you have a little more money to spend, the Minka-Aire Light Wave 52-Inch Ceiling Fan is a great splurge option that has a sleek design and dimmable lights. FAQ Which way should ceiling fans turn? Fan settings are arranged by the manufacturer so it is always best to check your specific fan guidelines first. However, if you do not have product information, the general rule is that in the summer months, the blades should rotate counterclockwise, which will create wind. In winter, the blades should rotate in a clockwise motion, which will push the air upwards and pull the warm trapped air down to increase the overall heat distribution. You can also do your own tests to make sure you have the right one for optimal energy savings. What size downrod do you need with your ceiling fan? Most standard ceiling fans come with a downrod, which is a piece of metal that connects your fan to the ceiling mount. There should be a minimum of 7 feet between the fan and the floor, so you'll need a downrod based on the height of your own ceiling. For an 8-foot ceiling, it is recommended that you use a flush mount; for a 9-foot ceiling, use a 6-inch downrod; for a 10-foot ceiling, use a 12-inch downrod; for a 12-foot ceiling, use a 24-inch downrod. How do you balance a ceiling fan? Wobbling is a common problem that can be fixed with blade balancing kits, which include adjustment clips and adhesive weights. Start by pasting a plastic clip over the center of any knife, turning on the fan, and observing the shake. Turn off the fan and move the clip to the next knife until you test all the blades, tracking which blades have clips when the ceiling fan vibrates the least. The clip should then remain on the knife closest to the inside of the fan. If that doesn't fix the problem, move the plastic clip out with a small increase until you find the fan's most balanced place. Remove the clip and place one of the heavy strips of self-adhesive in place of it in the middle, the top of the knife where it is not visible from the ground. Ultimate Ceiling Fan Buying Guide Ceiling fans are a household staple that is often underappreciated. Many people rely on air conditioning to stay cool in summer, but ceiling fans can help—without using nearly as much electricity. While fans don't lower the temperature or get rid of moisture, they help circulate the air throughout your home and make you feel colder thanks to the cold wind effect. Plus, many ceiling fans are a stylish addition to the house Ceiling fans have been around since the late 1800s, and the technology behind them is relatively simple. Electricity drives the central motor in the fan, which causes the blades to rotate. The blade is tilted at a slight angle—generally between 12 and 15 degrees—which pushes the air downwards towards the floor. When air hits your skin, it causes sweat to evaporate, making you feel although the room is technically the same temperature. Getty/Mark Jade Alpay/EyeEm Moving the air around may not look like it's going to make much difference, but a ceiling fan can make the room feel up to 8 degrees cooler thanks to the wind chill effect. It allows you to increase the thermostat to several degrees, saving significant money on energy. However, ceiling fans aren't just a one-season wonder. You can also reverse it during winter, which forces warm air down from the ceiling, helping you maximize your heating costs. To choose the right model for your space, consider things like your room size, ceiling height, and your home décor style. It's also important to set a budget when shopping for ceiling fans, as they can cost anywhere from \$30 to \$2,000, depending on size and style. Buying a ceiling fan is not as simple as choosing one that matches your décor. You will want to reflect on the following considerations before shopping. First, specify where your new ceiling fan will be installed. Indoor and outdoor ceiling fans are available. Outdoor fans are commonly used on terraces and terraces or in garages. As a general rule, you can put outdoor fans inside, but you can't put fans indoors outside. This is because outdoor fans are specially designed to withstand wet or humid conditions. Ceiling fans come in a variety of sizes, with blade ranges ranging from 29 inches to 56 inches or larger. When choosing the best fan size for your needs, you will want to consider the size of the room where it is placed. Here's a breakdown of the recommended fan sizes for rooms based on square footage: Less than 80 square feet: 36 inches or less80 to 150 square feet: 36-42 inches150 to 250 square feet: 42-52 inches250 square feet or more: 52 inches or more If your space is at the top or you prefer stronger airflow, you can choose a larger fan size. The Spruce/Bethany Wong High ceiling is another important consideration when choosing a ceiling fan, as it will dictate the optimal downrod length. A downrod is a piece of metal that connects your fan to a ceiling mount, and using a shorter or longer downrod will raise or decrease the fan, respectively. In general, you will want at least 7 feet between the fan and the floor. With this in mind, here's the recommended downrod length based on ceiling height: 8-foot ceiling: 9-foot mounting flush ceiling: 6-inch downrod10-foot ceiling: 12-inch downrod12-foot ceiling: 24-inch downrod When you shop, you'll want to consider how you plan to install a fan because you may need a special installation kit. If you have a low ceiling, you may need to flush out the fan, so make sure the product you purchased is compatible with this mounting style. Similarly, if you have a higher ceiling, you should shop for a downrod that matches the appropriate length. If you plan to attach a fan to the sloping ceiling, you will need a special, special angled ceiling adapter, attached to the outlet box to ensure the fan is hanging properly. There are several types of motors that drive ceiling fans. Alternating current motors of air conditioner, which have been used on ceiling fans for decades, are popular choices. This style of motor is affordable and reliable, and the modern ac motor is also relatively quiet. However, direct current motors or DCs have gained popularity in recent years as more homeowners turn to energy-efficient appliances. While more expensive, ceiling fans with DC motors use up to 70 percent less electricity and are very quiet. Furthermore, these motors are lighter, which makes mounting easier. Of course, you also want to consider the ceiling fan style you choose. Aspects such as finishing, blade style, and number of blades can all impact how well the product fits your décor. Today, you can find ceiling fans to match any design style, whether your home is traditional, modern, eclectic, industrial, or rustic. In general, experts recommend matching the motor with other hardware in the room—so if your kitchen has brushed the nickel hardware, find a fan with a brushed nickel motor. This will help create a seamless aesthetic. The number of blades on the ceiling fan also has an impact on the overall style. Traditionally, fans have four or five blades, but modern helicopter-style fans can have as many as nine! If you want a more industrial look, you might consider a fan with a cage around it, while those with bohemian styles might like the look of a palm leaf blade. If you're unsure about what will look best in your home, a few bars are reversible, giving you two designs to choose from—perfect if you want to change everything once in a while. The Spruce/Bethany Wong If you want your ceiling fan to have light, there are several options. First, you just have to buy a product that has integrated lights or a lightweight kit included with the purchase. Alternatively, you can buy a separate light kit and attach it to your chosen ceiling fan. This is a good choice if you are looking for a specific light style. Most lightweight kits are universal, so they can be mounted on lighting-compatible fans. However, it's always a good idea to double-check that the units you buy will work together, as some brands only make their fans compatible with their own lightweight kits. Finally, think about how you want to control your ceiling fan. There are three common options: remote control, wall switch, or pull-chain. The remote control is arguably the most convenient option, as it allows you to control the fan from anywhere in the room. However, some people don't want another remote to track, in which case a wall switch might be a better option. If you have a low profile ceiling, you can always choose a pull chain. While this can be a little confusing to operate, it's a simple option that can minimize installation costs. It is helpful to familiarize yourself with various various ceiling fan, as this will help you narrow down your options when you shop. Most people will eventually buy a standard ceiling fan for their home, but there are still many products that fall into this category. Think of standard ceiling fans as a non-specialty product. Standard ceiling fans come in a variety of sizes and styles, with or without lights, and with a variety of control and downrod options. They can cost anywhere from \$30 for a basic model to more than \$1,000 for a high-end one. If you think a remote-controlled ceiling fan is the best choice for your home, there are plenty of options to choose from, including a variety of sizes and styles. This option is slightly more expensive than the pull chain model, but you can still find a nice remote control fan for \$100. Spruce / Bethany Wong If you have a low ceiling and need a ceiling fan mounted on the flush, look for a product labeled low profile. This fan style is flushed to the ceiling without a downrod, ensuring they are as high as possible. Low profile fans can range anywhere from \$30 to a few hundred dollars. Looking for ways to reduce your energy bills? Then you may want to look for an Energy Star certified ceiling fan. To get this certification, the product must drive air 20 percent more efficiently than the standard model, and if the fan is equipped with a lightweight kit, the energy-saving design is 60 percent more efficient. Despite their energy-saving benefits, Energy Star ceiling enthusiasts are still reasonably priced, costing just \$50. As the name suggests, dual motor or dual head fans have two separate fans on one mount. Typically, these fans can angle in a variety of ways, allowing you to optimize airflow, and certain models even utilize two heads and/or allow you to control them separately. This particular ceiling fan style is more expensive than standard models, starting at about \$200 and starting at thousands. However, they are often a good solution for larger rooms where you don't always want to install two separate ceiling fans. If you already have smart home gadgets throughout your living room, you may want to consider a smart ceiling fan to advance your home automation. The smart ceiling fan connects to your home Wi-Fi network, allowing you to control it via smartphone. This lets you create schedules for fans and control them remotely. However, those with other smart home gadgets can reap the added benefits of a smart ceiling fan. Many smart fans are compatible with Amazon Alexa or Apple HomeKit, allowing you to control them with voice commands. Some popular models can be integrated with like the Nest Smart Thermostat, and both devices will work together to keep your home at the ideal temperature while reducing energy costs. Despite being admittedly high-tech, many fans of the smart ceiling are surprisingly affordable, starting at about \$200. If your fan will be placed somewhere that may be wet, such as on a terrace, you will want to make sure you get a fan made to withstand these conditions. You will find that outdoor ceiling fans are rated wet or rated wet, and this indicates where they can be installed. UL Damp Rated fans can be placed in humid indoor or outdoor locations—anywhere they won't be directly exposed to water or snow. They can withstand a bit of moisture, making it ideal for terraces, garages and even bathrooms, and you can find humid rated fans priced as low as \$100. UL Wet Rated fans are even stronger, and they can be directly exposed to the elements. This type of fan is best suited for pergolas, open decks, gazebos, and more. Despite their heavy-duty nature, fans rated wet are still reasonably priced, starting at less than \$100. Industrial or commercial ceiling fans are designed for large rooms—think barns, showrooms or warehouses. These products are usually much larger than standard fans, sometimes reaching up to 100 inches or more. If you're looking for a ceiling fan for a large industrial space, you'll probably spend at least \$400 on this type of heavy fan. The Spruce/Bethany Wong There are some famous ceiling fan brands you might encounter while shopping. Here's what you need to know about each. The brand has been around for over 100 years, and the goal is to balance quality with affordability. You can usually find Hunter fans with many desirable and innovative features, all at a reasonable price. This line, sold by Minka Group, is one of the most popular ceiling fan brands available today. High quality fans are fashionable, reliable, and affordable. Hampton Bay is Home Depot's own line of fans and ceiling lights, and as such, you should buy it through this big box retailer. Hampton Bay fans get the highest value from customers and are available at various price points, starting at \$50! A relatively new brand, Monte Carlo aims to provide a comprehensive and trend-inspired product line. Its fans are usually more modern and at the higher end of the price spectrum. However, this brand is a great choice if you want a high quality contemporary ceiling fan. If you are looking for an industrial fan or smart ceiling, you should consider products from Big Ass Fans. Not only does the company offer some great commercial styles, but its Haiku smart fan line is some of the top smart ceiling fans out there. There's nothing worse than buying beautiful new home supplies, just to burn them down in a few months. When shopping for ceiling fans, it is always a good idea to check specifically to see what's covered and what's not. Most ceiling fan manufacturers have their own warranty terms. For example, Hunter offers a limited lifetime warranty on its fan motors and will replace them for free if the motor fails due to defects in the material or workmanship. However, other parts of the fan, such as electronic components and covered only by a one-year limited warranty. Glass, light bulbs, and control batteries are not covered at all. You will want to review the manufacturer's warranty on the ceiling fan you eventually purchased and be sure to check if it is still covered if you purchased the product from a third-party retailer.
